ATO-IC series
Model:0.5kw-6KW

9 Quality guarantee

If the product fails during the quality assurance period, our company will provide free maintenance services or replace new products.

Evidence

During quality guarantee, our company requires customer shows purchase invoice and date of the products. At the same time, logo on the products should be clear and distinct, or we have the right not to provide quality guarantee.

Conditions

- Substandard products after replacement should be handled by our company.
- Customer should leave reasonable maintenance time to repair the failure equipment.

Responsibility immunities

Our company have the right not to provide quality guarantee on the conditions below:

- The whole machine or components have exceeded free guarantee period.
- Transportation damage
- Incorrect installation, modification or use.
- Operated beyond very harsh environment illustrated in this manual.
- Machine failure or damage caused by maintain, change or disassemble by non-our company services.
- Damages caused by abnormal natural environment.

Products failure caused by situations above, if customer requires maintenance service, we can provide paid maintenance service after our company service institution judgments.

Illustration

Any variation in product dimension and parameters will be subject to our company latest information, without prior notice.

7 Trouble shooting and solutions

Trouble shooting and solutions		
Abnormal phenomena		solution
inverter	Overheated	1. Pls check whether the inverter is placed next to the heat source. Whether the fan port of the inverter has a shelter and the fan is working.
	Overload	1. Reduce load
	Battery overdischarge	1. The battery capacity is small and pls reduce load. 2. Battery aging. Pls repalce battery. 3. Weather. Extended charging time
	Output short circuit	1. Checking circuit.If it is due to overload, pls reduce the electrical load and restart the machine.
	Mains is not charged	1. Check for mains input. 2. Pls select AC prority option for working mode in the menu and choose PV+AC for charging mode.
	No AC output	1.The system is in standby mode, pls restart. 2.The system is in alarm protection state, pls release the alarm.
Controller	PV is not charging	1.Whether the operating voltage of the photovoltaic module within the operating range of the MPPT controller. 2.Check if the voltage displayed on the PV system screen is accurate or not. 3.Check whether the photovoltaic input switch of the controller is disconnected or not.
	No curve display	1.Check whether the time on the controller screen coincides with the time in the location

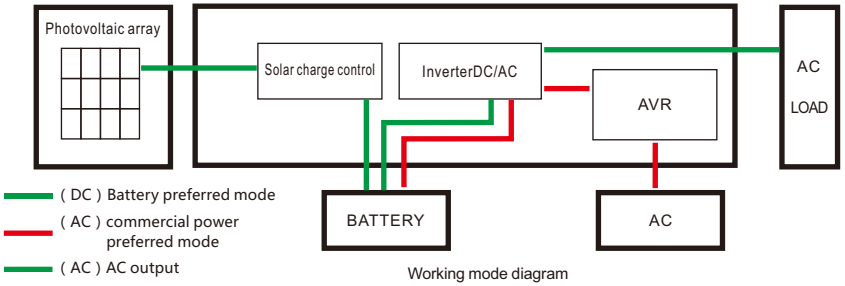
1 Safety instructions

Safety instructions

Operating	Danger ● Before operating, please make sure this product is operated within the allowed working range, otherwise, it will cause damage to this product. ● When do not use this product for long time, the battery should be full charged, and battery breaker should be disconnected to avoid battery full discharged caused by long term standing of battery ● When do not use this product for long time, it should be charged for more than 2-4 hours by AC or solar energy input after charging the battery breaker should be disconnected.
Maintenance overhaul	Danger When disassemble the shell, please do disconnect solar energy input, AC input, AC output and battery breaker, otherwise there will be risk of electric shock. Even after disassembling the sell, there will remains electricity inside the machine, please do no touch naked part of the wire directly to avoid electric shock. Maintenance and overhaul should be conducted by professional maintenance personnels, uses do not disassemble the machine by themselves, otherwise it will cause electric shock and damage to this product.
Others	Danger Transforming by oneself is prohibited to avoid serious accident. When abnormal situation appears inside the machine, please disconnect battery breaker and power source input and output wire immediately. If the machine is on fire by any chance, please use dry powder extinguisher and disconnect all switches immediately.

6 Work mode instructions

Work mode instructions



Working mode diagram

（1） （DC） Battery preferred mode

Under (DC) battery preferred mode, the batteries supply power to load, as shown of green arrow in the above picture.

1、not only the power produced by solar panels will supply to user's appliances, but also the redundant power will be restored in the batteries

2、When power produced by solar panels is not sufficient for user's load, the power restored in batteries will supplement to load.

3、When batteries's power is not sufficient, power produced by solar panels is not sufficient, the system will switch over to AC to supply power to load. If batteries' power is gravely insufficient, the system will switch over to AC to supply power to load, besides, it will automatically start up AC to charge for batteries. When batteries are full charged to 100%, the system will return to (DC) battery work mode automatically.

（2） （AC） commercial power preferred mode

Under (AC) commercial power preferred mode, commercial power supply power to load, it is output to load through system AVR and isolating part, to make sure the stability of output power source.

1. AC input supply power for user's load, at this time, power produced by solar panels only charge for batteries.
2. When batteries' power is gravely insufficient, except for supply power for users' load, AC will start up to auxiliary charge for batteries. But it won't fully charge to batteries.
3. When AC is off or abnormal, the system will switch over to batteries to supply power for load.

（3） Power saving mode

Under power saving mode, users can set the charging mode to PV charge preferred mode, at this time, AC will not charge to batteries.

（4） Off-peak power consumption mode

For countries and regions where electric accounted according to time-of use, users can set timing work mode switching according to requirements.Regarding off-peak power consumption function, it will use AC power during the time of low power grid load and cheap power rate, it will fully charge to batteries at the same time.During the time of peak power grid load, it will make use of power stored in batteries to realize the purpose of off-peak power consumption and save electricity cost.

5 Functional setting attention

6.Record query

In the default main interface, press the ENTER key to enter the main menu, press the DOWN key to select the record query, press the ENTER key to enter the record query, press the DOWN key or UP key to select the curve record query or fault record query, press the ENTER key to enter the curve record query or Fault record query, press the DOWN or UP key to enter the record, a total of 10 records. Press MENU to return to the previous menu and main interface.

16

6.4.11.2 Battery rated voltage

i The factory default is to automatically recognize the rated voltage grade. The automatic identification of rated voltage grade only identify lead-acid battery series. Lithium battery is not included in the automatic identification range. When the voltage grade is automatically recognized, the setting of charge voltage and the discharge lower limit voltage are not allowed. It must be manually set the voltage grade first, and then to set the charge voltage and discharge lower limit voltage.

i Lithium battery series only have float (constant voltage) charging mode, and the equalizing chargemode is use by lead-acid battery series.

1 Safety instructions

1.1 Safety responsibility immunities

Users should read this chapter carefully and operate according to safety cautions required by this chapter when installing, use and maintain this product. If there appears damage or loss caused by violation operations, it has no business with our company.

1.2 Safety sign illustration

Note: due to dangers caused by violation operations, it might result in moderate damage or light injury to person as well as damage to products.

Danger?Due to dangers caused by violation operations, it might result in fire, persons serious injury even death.

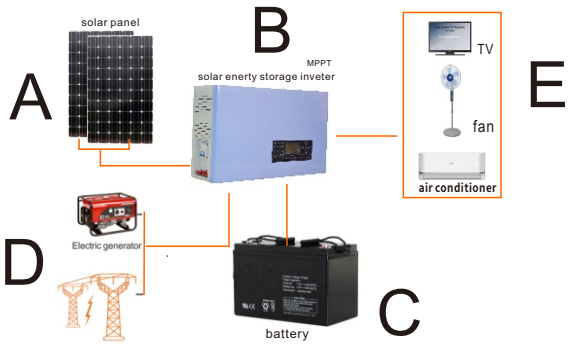
Safety instructions

Transport	Danger
	It should avoid strong vibration, fall, collisions and packing box upset down is prohibited during moving.Do not loss accessories, instructions and guarantee card etc. during unpacking and moving.
	Note
	Please pay attention to safety during moving to avoid harming to your body.
Unpacking and inspecting	Note
	• If product damage or lack of components, you can not install, or accident maybe happened. • If packing list not agree with the product, please do not install and contact supplier on time.
Installation	Danger
	• Wiring work must be conducted by qualified electrical engineering personnel, otherwise there is risk of electric shock or damage to the system • Must make sure power supply is off before wiring, or there is risk of electric shock or fire. • Solar energy input need good lightning protection, AC input has overload and electricity leakage protection. • Cables must meet with related requirements, distribution section must meet with safety regulations. • Installing must be conducted strictly according to installation steps illustrated in the following chapters, otherwise it will cause damage to products.
	Note
	• When moving and installing, please handling with care to avoid injuring feet or damage to products. • This product should be keep away from inflammable objects and heat source, as well as no shelter to back panel cooling fan. • When installing, do keep sundries from dropping inside the product, otherwise it will cause system failure. • The product must be ground connected reliably, ground wire should be as short as possible, to avoid electric shock.

2 Product description

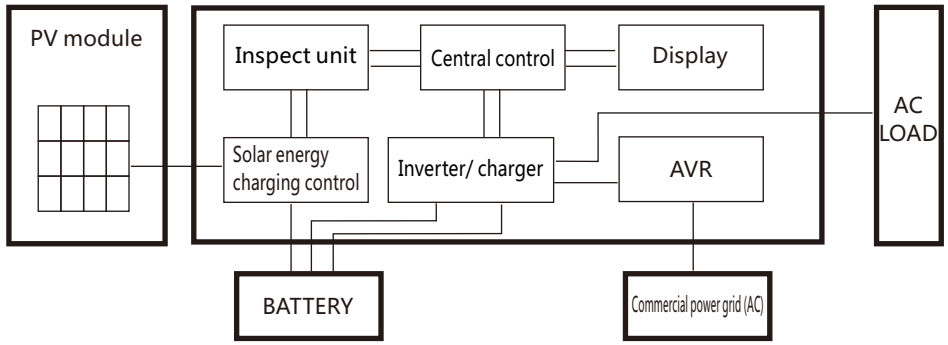
2.1 Consists of off-grid PV power system

The off-grid PV power system consists of PV modules, controller/ inverter, batteries and AC(power grid).



Name	Describe	Note
A	PV module	Monocrystalline, polycrystalline
B	inverter	Charging control unit/ inverter unit
C	Battery	Optional battery type(the defaultitem is lead-acid battery)
D	Commercial power grid (AC)	50Hz/220V、230V、240V 60Hz/110V、120V
E	AC load	Inductiveness, resistiveness, capacitive

2.2 System block diagram



5 Functional Setting attention

1.Factory reset password

When the operating parameters are set incorrectly to cause MPPT controller not work, the operating parameters can be restored to the factory settings.

Press DOWN key 3 times and press UP key 3 times, then press ENTER key to enter the operation parameter

2.Charge votage setting

Lithium battery series only have float (constant voltage) charging mode, and the equalizing chargemode is use by lead-acid battery series.

3.Battery type setting

The factory default is to automatically recognize the rated voltage grade. The automatic identification of rated voltage grade only identify lead-acid battery series. Lithium battery is not included in the automatic identification range. When the voltage grade is automatically recognized, the setting of charge voltage and the discharge lower limit voltage are not allowed. It must be manually set the voltage grade first, and then to set the charge voltage and discharge lower limit voltage.

4.Operation parameter setting

Note: The operation parameter setting must be conducted by qualified electrical engineering personnel, otherwise the mis-operaton might cause the MPPT does not work or damage the battery.

Note: Before setting the operating parameters, you must disconnect the PV module from the MPPT controller. Then in order set below parameter: 1. battery type setting, 2. the rated voltage setting, 3. the charging voltage setting, 4. the charging current setting, 5.the discharging lower limit setting. And then check the displayed parameter of system information whether it is consistent or not.

5.Power test run

Note: Before power test, please check all the DC wire positive and negative terminals are fully connected correctly.

Please follow below steps to operate:

1. Check the positive and negative terminals of wire must be full connected correctly, and measure that whether the open circuit voltage of the PV module is within the operating range of the controller.
2. Firstly, turn on the circuit breaker of the connection of controller and battery.
3. Secondly, turn on the circuit breaker of the connection of controller and solar panel.
4. Finally, the controller starts to enter the self-test mode; if the system conditions are correct, the controller automatically enter the work mode; if the system conditions are not correct, the controller will be a fault prompt, refer to the chapter to solve the fault.
5. Battery type, the controller factory default is lead-acid battery, please refer to the battery type settings.
